Case Study 56: The IAM Policy Conflict

Industry: Cloud Administration Problem Statement: A user has two conflicting policies: one allowing and one denying storage access, causing total lockout.

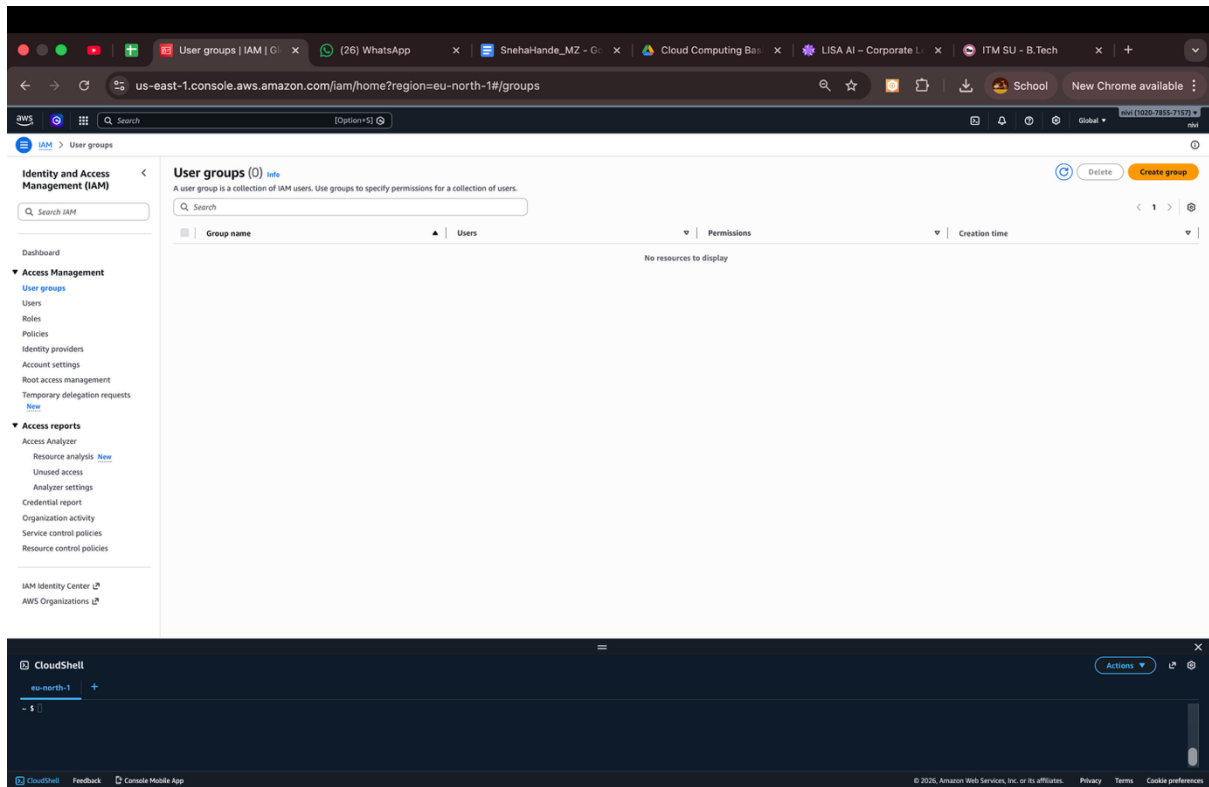

Technical Implementation:

- Review the "Effective Permissions" for the IAM user in the console.
- Identify the explicit "Deny" policy causing the conflict.
- Remove the conflicting rule and validate access.

Pricing Strategy:

- Zero-cost troubleshooting of complex IAM issues.
- Avoid "Productivity Loss" by resolving access conflicts rapidly.

No user groups are created yet; this page is used to manage permissions for multiple users together.

An IAM user is an entity that you create in AWS to represent the person or application that uses it to interact with AWS..

Step 1: Specify user details

Step 2: Set permissions

Step 3: Review and create

User name

Exam-practical

The user name can have up to 64 characters. Valid characters: A-Z, a-z, 0-9, and +, =, @, ., -, (hyphen)

☒ Provide user access to the AWS Management Console - optional

In addition to console access, users with `SignInLocalDeveloperAccess` permissions can use the same console credentials for programmatic access without the need for access keys.

Here you are entering the IAM username and enabling console access for login.

Console password

☐ Autogenerated password

You can view the password after you create the user.

☒ Custom password

Enter a custom password for the user.

• Must be at least 8 characters long

• Must include at least three of the following mix of character types: uppercase letters (A-Z), lowercase letters (a-z), numbers (0-9), and symbols (! " \$ % & ' * () , - . : ; = ? [\] ^ _ ` { | } ~)

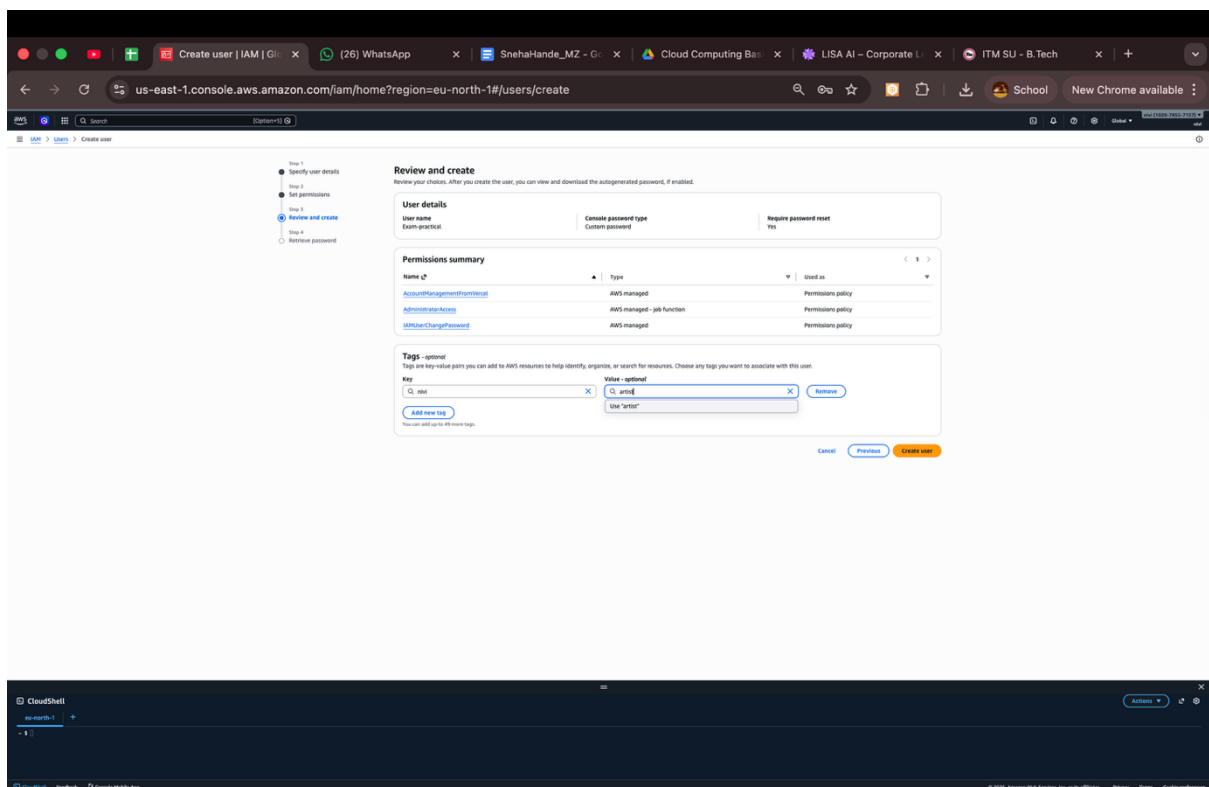

☒ Show password

Next

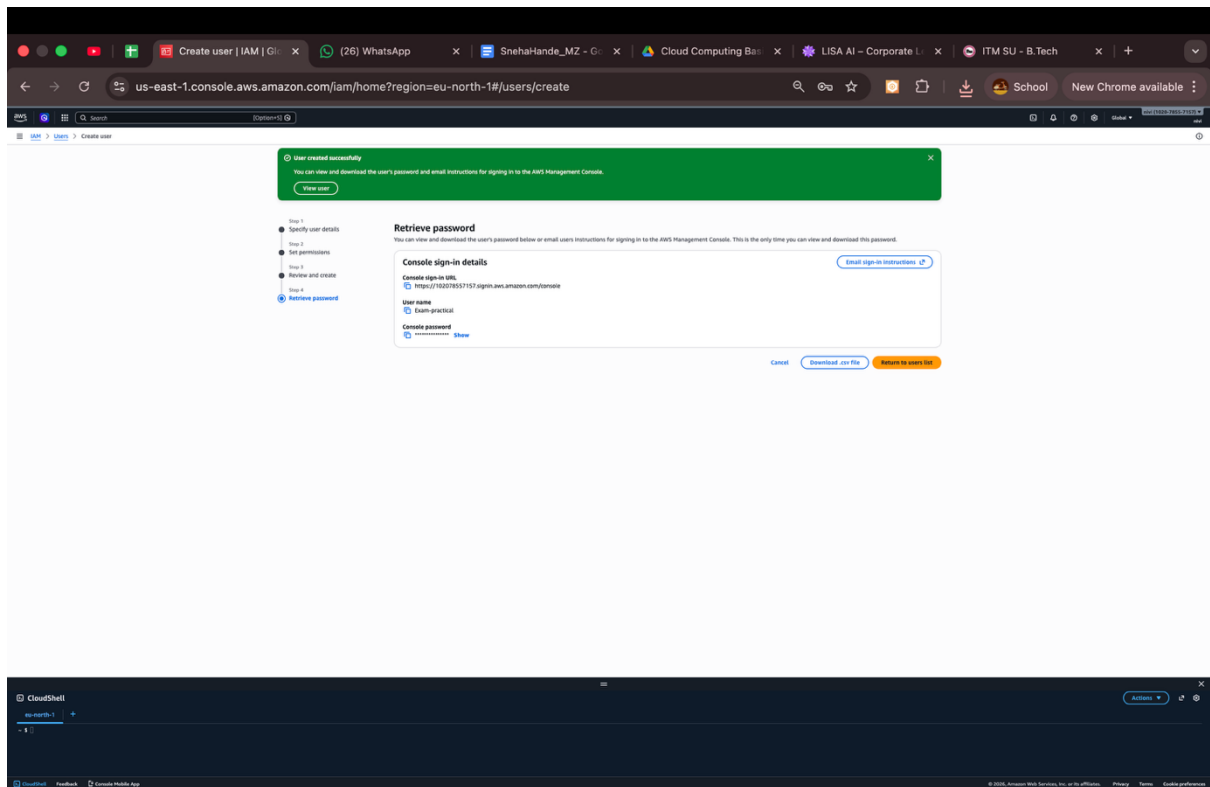

You are setting a custom password so the user can securely log into AWS.

Here you assign permissions by attaching policies (like S3 or admin access) to the user.

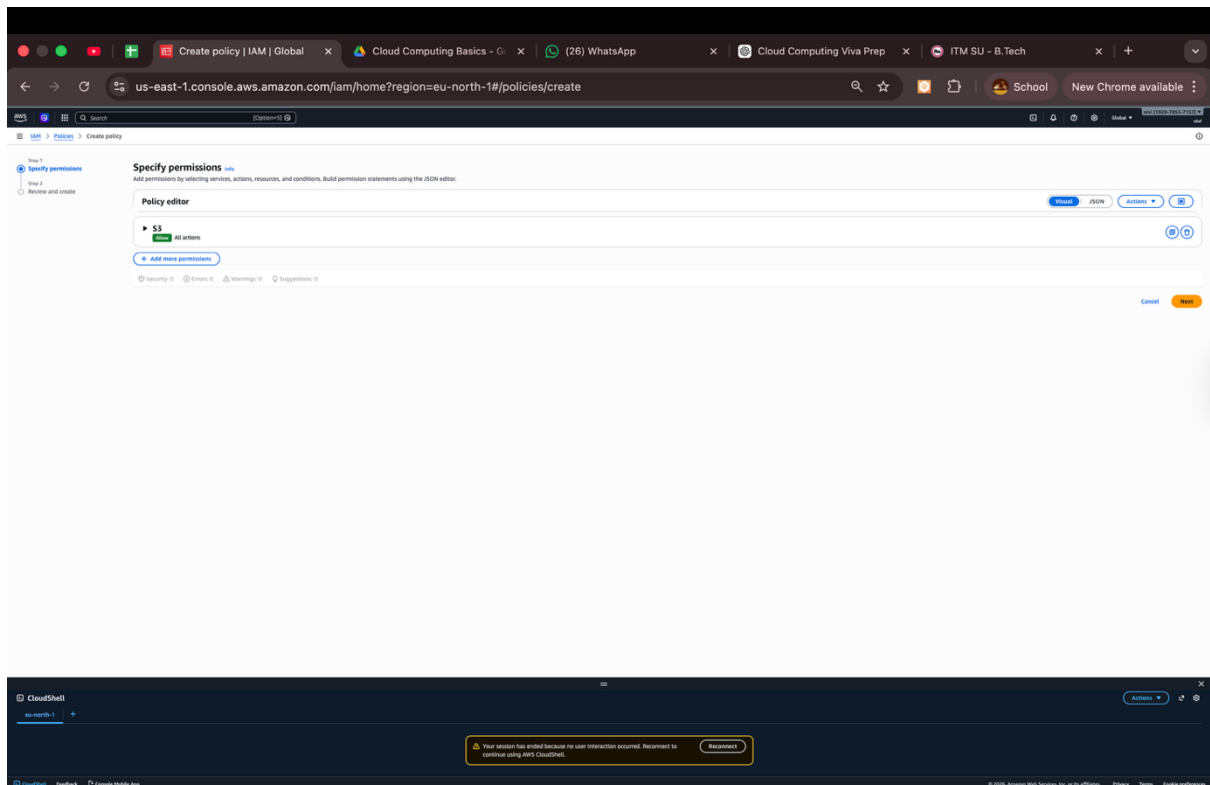

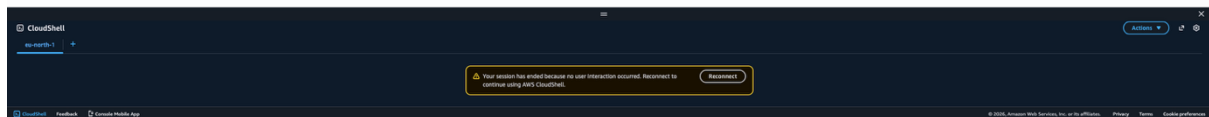

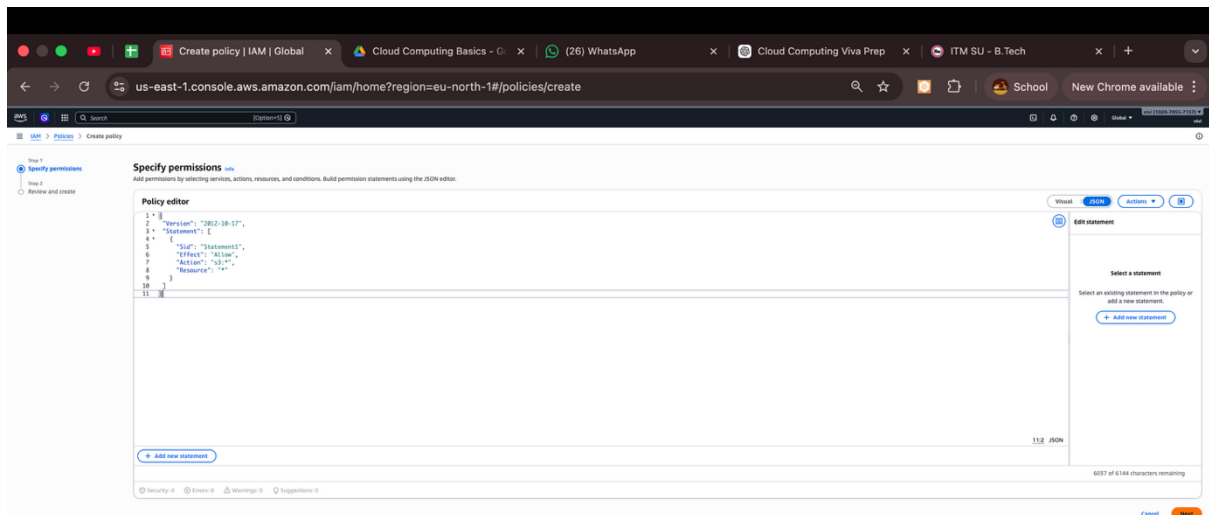

This step shows a summary of user details and permissions before creating the user.

The IAM user is successfully created and you can download login credentials.

Policy setup

Product Building:

- A "Clean-Policy" identity framework.
- Predictable access control management
